PROJECTIONS OF LONG TERM CARE NEEDS IN IHS AREAS

The enclosed tables represent an application of area specific rates of functional limitation to the population projections for each service area. This results in a series of tables estimating the numbers of persons at each level of functional limitation that will be present in the Native American population now and in the future. This analysis simply extends the analysis done on a national scale last year and employs prevalence rates as well as population projections developed at the National Resource Center on Native American Aging.

Additionally, the projected population at each level of functional limitation for each projected year was submitted to a rate representing the national norm for type of care received. This norm was derived from data published by the Agency for Health Research and Quality regarding patterns of care. The result provides an estimate of the number of persons residing in community settings that would rely on informal care, a combination of formal and informal care or exclusively on formal caregivers. The resulting figure is useful for establishing just how much care would be required to achieve national levels of service and takes into account the enormous volume of informal caregiving that supports our older population in the United States. This is particularly valuable because it takes into account recognition that the network of formal services was never intended to accommodate all cases of activity limitation. These numbers allocate an enormous portion of the caregiving task to informal caregivers, and yet allow us to recognize the extent of under-service in the 11 Indian Health Service areas. (Note - Tucson was not included as our data base has no representation from that service area)

After acknowledging that Tucson is not represented, the cumulative profile projected for the remaining 11 service areas for 2010 will contain 107,018 persons residing in the communities with 1 or more functional limitation. Among this 107,018 persons, if national norms for care are

applied, there will be 38,088 receiving formal care in combination with informal care services from family and friends and an additional 6,833 persons depending exclusively on formal care.

We lack data on the precise numbers of formal services that are available to community residents and being used for each of these areas. Nursing home use was also estimated, in this case using a multiplier – a ratio of institutional residents in the national population to community residents at each level of severity for functional limitation. The ratios are 87 nursing home residents per 1000 community residents at the moderate level of limitation, 242 nursing homes residents per 1000 community residents at the moderately severe level of limitation and 1,027 nursing home residents per 1000 community residents at the severe level of limitation. These estimates are found in the fourth column of the population expected to receive care for each estimate year. The reader should keep in mind that these estimates are what would be expected if national norms were applied to the service area populations. They do not reflect actual numbers institutionalized.

These projections should be useful for planning purposes and for documenting the volume of present and future service needs while accounting for a normal level of informal caregiving. One should be cautious, however, as the areas with the smallest numbers of functional limitations also have the lowest life expectancies by a significant margin. Attention to long term care needs or health care in general must not be dictated strictly by demographic size. If it is, a self fulfilling prophecy will be realized.

Estimates of population with functional limitation and the numbers who would received informal, formal or combined care using national norms.
